

## XtraCore+

---

XtraCore+ is constructed of a first and second layer of braided polyethylene, with a core that is a third inner layer of polyester filaments with an addition of DSM's super-strong ultra-high molecular weight polyethylene (UHMWPE), which gives it a higher coefficient of friction, helping its durability against adverse climates, highly demanding tides and currents and, above all, attacks by predators, such as seals.

## Knotless Raschel Netting

---

A lower cost type of net that is used in many industries and can be produced using Nylon or Polyester fibres. In aquaculture, Raschel Nets are a solid alternative in terms of cost/benefit and are used frequently in fish farming for species such as salmon, tilapia, trout, sea bass, sea bream, and more.

Nylon: Lighter weight with same break strength as polyester, yet more elongation.

Polyester: Better abrasion resistance, higher UV resistance, lower cost of production. Shrinks less than nylon which can result in a saving on repairs.

## Bird Nets

---

Essential for protecting your livestock from any unwanted attention and predation from birds, bird nets can be made to the farmer's specification and needs.

The bird nets we provide are manufactured with UWHDPPE, HDPE, or PP which due to its lightweight, easy handling and high break strength properties offers tremendous, long life results. The bird net is designed and constructed around the pen's dimensions where the bird net will be installed.
